
Quick-start — If you only have 2 hours

For those who want to see the system running before reading the full playbook. Follow these 7 steps and your first strategic report lands in 2h.

What you need

- An n8n account (cloud or self-hosted)
 - A Supabase account (free tier)
 - An Apify account (~€20 of credit covers months)
 - An Anthropic API key (€5 is enough)
 - A YouTube Data API v3 key (free)
-

1. Supabase — create the database (10 min)

1. Create a project at supabase.com
 2. Grab **Project URL** + **Service Role Key** (Settings → API)
 3. SQL Editor → paste `delivery/supabase-schema.sql` → Run
-

2. Seed your competitors (15 min)

In the SQL Editor:

```
insert into competitors (name) values ('Competitor A'), ('Competitor B');

insert into competitor_handles (competitor_id, platform, handle, status)
select id, 'instagram', 'competitor_a', 'approved' from competitors where name = 'Competi'
```

Repeat for Instagram, TikTok, YouTube, LinkedIn.

For YouTube, also add `channel_id` in `metadata` (get it from commentpicker.com/youtube-channel-id.php).

3. API keys (15 min)

Collect your 4 keys:

- Supabase → Settings → API
- Apify → Settings → Integrations
- YouTube → console.cloud.google.com → enable YouTube Data API v3
- Anthropic → console.anthropic.com

4. Import the 5 workflows (20 min)

In n8n, + **Add workflow** → **Import from File** for each of:

- `01-instagram-collector.json`
- `02-tiktok-collector.json`
- `03-youtube-collector.json`
- `04-linkedin-collector.json`
- `05-weekly-report-generator.json`

Ctrl+F inside each workflow → replace every `PASTE_YOUR_*_HERE` with your real keys.

5. Gmail credential (10 min)

In n8n: Credentials → New → Gmail OAuth2 API. Follow the OAuth flow. Inside workflow 05, select this credential on "Send via Gmail" and replace `PASTE_YOUR_RECIPIENT_EMAIL_HERE` with your own email.

6. Test every workflow (30 min)

For each collector (01 to 04):

1. **Manual Trigger** → **Execute Workflow**
2. Check every node is green
3. Go to Supabase → `channel_metrics` → rows should appear

If a workflow fails, inspect the red node → fix the key or handle involved.

7. Activate and wait (5 min + a few days)

Activate all 5 workflows (top-right toggle).

Wait 2-3 days for data to accumulate. Run workflow 05 manually to generate the first report. From the following Monday, everything runs on auto.

Want to go further?

- Read the **full playbook** (`playbook-en.md`) to customise analysis, add platforms, change frequency
 - Join the [Taiyka Skool community](#) — advanced pipeline, weekly lives, all my calibrated prompts
